Introduction

In accordance with Section 207 of Title 58.1 of the **Code of Virginia**, the Virginia Department of Taxation (“Virginia Tax”) conducts an annual real property Assessment/Sales Ratio Study covering every county and city in the commonwealth. This report summarizes the results of the 2022 Study. The study estimates the assessment/sales ratio for each locality by comparing assessed values to the selling prices of bona fide real property sales. A locality's total fair market value of real estate, divided by its assessment/sales ratio, produces an estimate of the locality's total true (full) value of real estate. The local true values developed in this study are used as a factor in Virginia's basic school aid distribution formula. The study also determines the effective local true tax rates across the commonwealth. The effective true tax rate (expressed per \$100 of true value) provides an appropriate means of comparing tax rates on similar properties in different taxing jurisdictions. The study also serves as an element in the determination of assessed values for public service corporation property in each locality of the commonwealth. Finally, the study evaluates the level of uniformity in the assessment of real property within and across jurisdictions of the commonwealth.

The 2022 assessment/sales ratios are calculated from a statistical sample of all fair market real estate sales in tax year 2022. Virginia Tax allows localities to file all their real estate transactions directly with our agency in a prescribed format. The 2022 assessment/sales ratio study utilized 122,469 sales throughout the commonwealth. We compared each selected parcel's assessed value in tax year 2022 to its sale price to calculate an assessment/sales ratio. The best indicator of a locality's overall assessment/sales ratio is the median, or midpoint of the ratios when arrayed by value. The median ratio captures the real estate market's level of assessment since the last reassessment; a low median ratio may indicate an increasing market. However, a median ratio close to or more than 100% (where assessed values closely approximate sales prices) may indicate that a reassessment has been undertaken recently or may indicate a declining market. Reassessment cycles in Virginia range from annual to every 6 years.

The study reports standard statistical measures, such as the coefficient of dispersion and the price-related differential, to examine the level of uniformity in the assessment of real property by property class within and across jurisdictions in Virginia. The coefficient of dispersion is based on the average absolute deviation as recommended by the International Association of Assessing Officers (IAAO). It measures how closely individual ratios are grouped around the median, the smaller the measure of dispersion, the greater the uniformity of the ratios. The price-related differential compares the assessed values of less expensive properties with those of more expensive properties. It evaluates the relative tax burdens of owners of low-valued properties and owners of high-valued properties. The statistical terms, methodology used for computation, and sources of data are detailed in the appendices.

Results of the 2022 Assessment/Sales Ratio Study

Median Ratio and Coefficient of Dispersion

Table 1 contains the median assessment/sales ratio and the coefficient of dispersion for every county and city in the commonwealth. Table 1 also shows the total fair market value of real estate, the number of sales in the sample, and the latest year of reassessment, which are among the several factors that affect the median ratio and the coefficient of dispersion. Per the IAAO Standards on Ratio Studies, an appraisal level between 90% and 110% is considered acceptable for any class of property. Figure 1 indicates that the 2022 median ratio ranges between 90% and 110% for 2 of Virginia's 95 counties and 3 of its 38 cities. Of 133 localities, 95 localities have assessment levels between 70% and 130%, the parameters set forth by the **Code of Virginia** Title § 58.1-3259.

Figure 2 indicates that the coefficient of dispersion is less than 15% in 28 counties and 27 cities.

In addition to the 31 localities that undertook an annual reassessment, 31 other localities had reassessments effective for 2022. Reassessments typically result in higher or lower median ratios as assessed values are brought into line with selling prices. Title § 58.1-3201 and -3259 of the **Code of Virginia** require that real estate reassessments be at 100% of fair market value.

The sample used in this study consists of 122,649 sales, covering 6 classes of property. Table 2 examines the variation in median ratios across localities for all 6 classes: (1) single-family residential urban, (2) single-family residential suburban, (3) multi-family residential, (4) commercial and industrial, (5) agricultural/undeveloped 20 -100 acres, (6) agricultural/undeveloped over 100 acres. Sales in the single-family residential urban and suburban classes dominate the total sample, with 84,504 class 1 urban sales and 32,025 class 2 suburban sales. A breakdown of sample points, by locality and property class, is given in Appendix 2.

Nominal and Effective Tax Rates

Table 3 provides the nominal and effective true tax rates for 2021 and 2022 for each locality. The 2022 median assessment/sales ratio for Virginia was 82.36%, a slight decrease from 83.27% in 2021. The steps in the computation of Virginia’s median ratio are detailed in Appendix 3. The 2022 nominal tax rate for the commonwealth was equal to \$0.9529 per \$100 of assessed value, while the estimated effective tax rate for the commonwealth was \$0.7848 per \$100 of true value. Figure 3 shows that the nominal tax rate for 76 of Virginia's 95 counties and 1 of Virginia’s 38 cities was less than \$0.80 per \$100 of assessed value. The nominal tax rate was greater than or equal to \$1.00 per \$100 of assessed value in 4 of Virginia’s 95 counties and 25 of Virginia’s 38 cities.

Localities' effective true tax rates tend to be somewhat lower than their nominal tax rates. Figure 4 shows that effective tax rate was less than \$0.80 per \$100 of true value for 91 of the 95 counties and 17 of the 38 cities and was greater than or equal to \$1.00 per \$100 of true value for 8 of the 38 cities.

Estimated True Value of Property

Table 4 provides the total estimated true full value of the locally taxed property for real estate and public service corporations. The total estimated true value for Virginia was over \$1.749 trillion in 2022, which is approximately 8.1% higher than the figure for 2021. The estimated true value of real estate excluding public service corporations (the total fair market value reported in the local land book divided by the median assessment/sales ratio for the locality) was over \$1.689 trillion, which is approximately 8.3% higher than in 2021. The total estimated true value of public service corporations was over \$59 billion; that figure includes the value reported by the State Corporation Commission, as well as the estimated true value of railroad and interstate pipeline transmission property.

Table 5 provides the per capita estimated true full value of the locally taxed property for real estate and public service corporations. Across the commonwealth, the total estimated true value averaged \$201,179 per capita. While the estimated population in Virginia increased by about 0.48% from 2021 to 2022, the estimated true value per capita increased by about 7.61%.

Appendix 1

Methodology and Terms

Virginia Tax has adopted a method of collecting data in a prescribed format. The **data** is derived from the recordation tax receipts that the law requires the Clerk of the Court in each. We obtain the transfer data from the Supreme Court of Virginia, the Clerk of Court, a contractor, or the local assessment officers. For each transfer, the listing indicates the date of recordation, the instrument number and document type, the name of the grantor and the grantee, the sale price, and a description of the parcel. Virginia Tax collects information from the local assessment offices on the assessed values and the class codes of the properties for a sampling of the transactions. Localities may include their entire qualifying ("arms' length") population in the study with minimal cost of data collection to Virginia Tax.

Fair market sales are defined as "arms' length" transactions in which there is a willing buyer and a willing seller, neither of whom is under pressure to buy or sell. This excludes such transfers as sales within a family, foreclosures, or sales to a government unit.

The **number of sales** selected in the study is determined by the personnel of our Property Tax Unit in consultation with the localities' assessment officer. Only arms' length sales are selected from the total number of transfers reported in the land records of a locality.

The assessed value for each sale is divided by its selling price to produce an assessment-to-sales ratio. The ratios for each sale in a locality are arrayed by numerical value, and the **median ratio** is selected as the best indicator of that locality's existing assessment/sales ratio. The median ratio is defined as the ratio value where half the ratio values are higher, and half the ratio values are lower. The median ratio is unaffected by distortions caused by large sales or "extreme" ratios at either end of the spectrum, particularly those at the higher end. The National Association of Tax Administrators, the U.S. Department of Commerce, and a special committee of the International Association of Assessing Officers (IAAO) recognize the accuracy of the median ratio. The median ratio for the state is calculated by dividing the state's effective tax rate by the state's nominal tax rate.

The **coefficient of dispersion** in this report is based on the measure recommended by the IAAO. This measure represents the mean percentage deviation from the median ratio. This average absolute deviation method based on all sample data has been used by Virginia Tax in every annual Assessment Sales Ratio Study since 1993.

Mathematically, if X_i represents the assessment/sales ratio for the i th sale in a sample of size n , and X_m represents the median ratio of the sample, the Coefficient of Dispersion = $\left[\frac{\sum[\text{Abs}(X_i - X_m)]}{n} / X_m\right] * 100$. It is calculated by:

- (1) Subtracting the median ratio from each ratio in the sample
- (2) Taking the absolute value of the calculated differences
- (3) Summing the absolute differences
- (4) Dividing by the number of ratios to obtain the 'average absolute deviation'
- (5) Dividing the average absolute deviation by the median ratio
- (6) Multiplying by 100

The coefficient of dispersion calculated by this method is affected by the size of the sample (n), that is, the number of sales of property used in the study for a locality. Comparing 2 localities with the same median ratio and similar spread, the coefficient of one may be larger if it has a smaller sample size.

A small coefficient of dispersion indicates that the ratios are grouped relatively close to the median and that the assessment of property is more equitable. A large coefficient indicates that there is a widespread in the ratios around the median, reflecting a less uniform assessment of property. The acceptable level for the coefficient of dispersion depends on the type of property considered and the size of the sample. The IAAO notes that a coefficient of 15% or less tends to be associated with good appraisal uniformity and indicates a good distribution of assessments for single-family residential properties. Similarly, a coefficient of 20% or less indicates a good distribution for more diverse classes of property. A less uniform assessment translates into inequality in tax burdens. As market activity decreases or the complexity of properties increases, the coefficient of dispersion often rises, even though appraisal procedures may be valid. Variation in assessments may be a result of the length of the period between reassessments, the difficulty of obtaining fair market value for different types of parcels, and the unique characteristics of different properties, among other factors.

Total fair market value includes the value of land, buildings, and improvements, as well as minerals under the surface, and standing timber (trees) not owned by the owners of the parcel. This information is based on land book records and reported every year to Virginia Tax by the local Commissioners of the Revenue and assessors. The fair market value refers to the value associated with the localities' tax year 2021 reassessment.

The **price-related differential** is defined as the mean ratio divided by the sales-weighted ratio. The **sales-weighted ratio** is the total of the assessed values divided by the total of the selling prices of all sales in the classification. Transfers with a larger selling price to have a greater impact on the ratio than those with smaller selling prices. A value of 1.00 indicates a uniform relationship between assessed values and selling prices of properties with different prices. A differential above 1.00 indicates that less expensive property has a higher assessment/sales ratio than more expensive property. A reasonable price-related differential may be in the range of 0.95 to 1.05, but tax experts have not reached a consensus regarding this neutral range.

The **nominal tax rate** for a locality is the rate of tax per \$100 of assessed value that is levied for county/city and district purposes. The tax rate is calculated by dividing the real estate levies by the local real estate taxable value, as reported from the local land books by the local Commissioners of the Revenue. Some localities impose additional district levies so that the rate is higher than the county levy reported in the **Virginia Local Tax Rates Bulletin**. The nominal tax rate for the state is obtained by dividing the total local real estate levies by the total taxable real estate value of all counties and cities.

The **effective tax rate** for a locality is calculated by multiplying the nominal tax rate by the median assessment/sales ratio. The effective tax rate for the state is computed by multiplying the total fair market value for all counties and cities by the state nominal tax rate and then dividing by the total true value of real estate for the state.

The **total estimated true value** of locally taxed property is composed of two components: real estate and public service corporation property. The estimated true value of real estate is computed as the total fair market value reported in the local land book, divided by the median assessment/sales ratio for the locality. The public service corporation component includes the value reported for each locality annually by the State Corporation Commission plus the estimated true value of railroad and pipelines for each locality as reported by the Railroad and Pipeline Appraisal section of the Property Tax Unit of Virginia Tax.

The estimated **true value per capita** of locally taxed property is defined as the true value of property divided by the 2022 estimates for the population as reported by the University of Virginia, Weldon Cooper Center for Public Service.

Appendix 2

Computations for State Median Ratio

1. The Nominal Tax Rate for Virginia is obtained by dividing the total of the local real estate levies by the total taxable fair market real estate values of all counties and cities. Data on taxable value and local levies are as reported, at the time of this publication, from each locality. Reference Table 6.2 of the **Virginia Department of Taxation's Annual Report** for final figures of local levies and fair market value.

The following localities conducted fiscal year reassessments and utilized a fiscal year land book; their data refers to the reporting year 2021-2022:

Counties: Bath	Cities: Buena Vista	Lexington	Poquoson
Charlotte	Covington	Lynchburg	Virginia Beach
Isle of Wight	Danville	Manassas Park	
Mecklenburg	Franklin City	Newport News	
	Fredericksburg	Norfolk	

The following localities conducted calendar year reassessments but utilized a fiscal year land book; their data refers to the reporting year 2022.

Counties: Charles City	Cities: Chesapeake	Martinsville	Suffolk
Greene	Falls Church	Petersburg	Williamsburg
James City	Hampton	Portsmouth	
Prince George	Harrisonburg	Roanoke	
	Manassas	Salem	

All other localities conducted calendar year reassessments and utilized a calendar year land book; their data refers to the reporting year 2022.

State Nominal Tax Rate = Total Local Levy / Total FMV Taxable * 100

State Nominal Tax Rate = \$13,262,462,529 / \$1,391,780,142,396 * 100

State Nominal Tax Rate = \$0.9529 per \$100 of Assessed Value

2. The Effective Tax Rate for Virginia is computed by multiplying the sum of the total taxable fair market real estate values for all counties and cities by the state nominal tax rate and then dividing by the total estimated true value of real estate for the state.

State Effective Tax Rate = Total FMV Taxable * Nominal Tax Rate / Total True Value of Real Estate

State Effective Tax Rate = \$1,391,780,142,396 * 0.9529 / \$1,689,940,711,366

State Effective Tax Rate = \$0.7848 per \$100 of True Value

3. The Median Ratio for Virginia is calculated by dividing the state effective tax rate by the state nominal tax rate.

State Median Ratio = State Effective Tax Rate / State Nominal Tax Rate

State Median Ratio = \$0.7848 / \$0.9529

State Median Ratio = 82.36%
